

## FireScope Tech Brief : FireScope Discovery

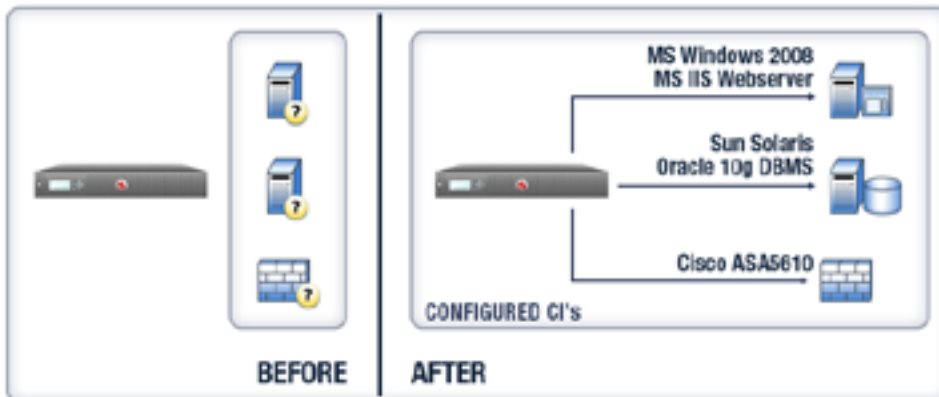

“One of our Major concerns was minimizing the “care and feeding” of our monitoring solution. FireScope discovers new systems as they are added and automatically adds and updates them.”

-- FireScope Customer

A BSM Management solution is only as good as the information it gathers and the systems that it contains. With many solutions, it is the gap between the known and unknown systems in an environment that means the difference between success and failure. This gap leads to questions such as, “What systems comprise my Business Critical Services and Applications?” or “How can I find and identify what is important about my IT Enterprise?”

The FireScope Discovery process bridges this gap by locating and identifying the systems and applications in your enterprise. IT assets are identified with respect to manufacturer, operating system and other critical software components. What's more FireScope also detects and identifies many Commercial software applications installed on these systems. FireScope takes this a step further in that not only are these assets

identified, but they are also acted upon. By providing an easy to use rules language, FireScope provides the ability to automate the configuration of discovered IT assets. With a few simple discovery rules, the user can not only locate new IT assets and automatically add them to the FireScope appliance, but can also discover changes to currently configured IT assets and update them based on the results of the latest discovery execution.

### Key Features

- Discovers IT assets and devices on your network using sophisticated fingerprinting technology
- Identifies installed Commercial applications and software
- Can be run on-demand or scheduled on a repeatable basis
- Includes automated action rules to configure, update and maintain the FireScope configuration in conjunction with the latest discovery results

### Business Value

- Automatically identify system and software in your IT Enterprise.
- Bridge the gap between known and unknown systems to provide a more comprehensive business service view
- Provides a self-maintaining solution by discovering changes and automatically updating your FireScope configuration
- Assists with new deployments and mass rollouts through configuration automation

### Competitive Advantage

- Simple discovery rule configuration
- No additional software to purchase, discovery is built right in
- Discovery capabilities are common to all FireScope offerings including Dash, Unify and Comply
- Discovered assets can be automatically mapped and configured into the FireScope framework leveraging existing templates, service definitions and policies
