

FireScope Tech Brief : Reconciliation

“Rather than asset management dressed up by marketing, we offer powerful configuration and change management at unmatched affordability and ease of use.”

- FireScope

Once assets are imported, the real challenge is figuring out what to do with data once you have it. FireScope Orchestrate makes reconciliation a breeze. Our easy, visual process allows users to customize plans and create rules with no programming necessary. Incoming data is shown side by side with the relevant existing data, allowing you to easily see and choose what you want to import based on previously defined data integrity scoring. Drag-and-drop built reconciliation rules let you define custom logic to process large batches of federated assets. And our integrated planning mode feature allows you to preview planned changes in a virtual sandbox as if they were actually part of the system. No other product makes it faster or easier to control the reconciliation process.

With data integrity scoring, you can specify and track reliability of information from particular sources, as well as the length of time that information should stay trusted. A CMDB contains a wide variety of data federated from many different sources, and without context it can be difficult to know how reliable or up-to-date any given piece of information might be. FireScope Orchestrate with data integrity scoring lets you look back and see historical information for both attributes and assets as data is changed or updated from different sources over time.

Key Features

- Track the reliability of your assets at the attribute level with integrity scoring and data integrity sources.
- Reconciliation is integrated with all federation sources.
- Integration with planning mode allows you to tweak and preview assets before they are imported.
- Attribute level, rules based reconciliation with integrated impact analysis.

Business Value

- Cut costs by eliminating redundant and inaccurate data.
- Improve efficiency with rules based reconciliation.
- Leverage data integrity information to increase accuracy in business decisions.
- Know where your data is coming from with data integrity sources.
- Learn from the past with full historical information at the attribute level.

Competitive Advantage

- Easy visual reconciliation – no learning curve or programming required.
- Get up and running immediately – you can start reconciling right away.
- Close integration with Change Management for full control and audit history.
- Only product where you can preview asset changes to your system as if they were actually there.
